

Outline

CSS: Cascading Style Sheets

Objectives

- Topics covered:
 - using a style sheet to give all the pages of a Web site the same look and feel.
 - style sheet types and cascade precedence
 - CSS syntax for assigning style properties
 - Class selector and using the `class` attribute to apply styles.
 - using style sheets to separate presentation from content.

Introduction

- Cascading Style Sheets (CSS)
 - Separation of structure from presentation
 - Relationship between the style formatting and the structure/content is no longer 1:1
 - multiple style sheets can be applied to the same Web page
 - Same style sheet can be applied to the multiple Web page

Multiple Levels of Style Definition

- Cascade Precedence: resolves conflicting style rules
 - Inline style sheets
 - Embedded sheets
 - External style sheets
 - Author vs. User

Inline Styles

- style information is directly attached to the HTML elements they affect
- higher cascade precedence than the other specification methods
- declaring an individual element's format:
 - Attribute style
 - CSS (style) property
 - Followed by a colon and a value

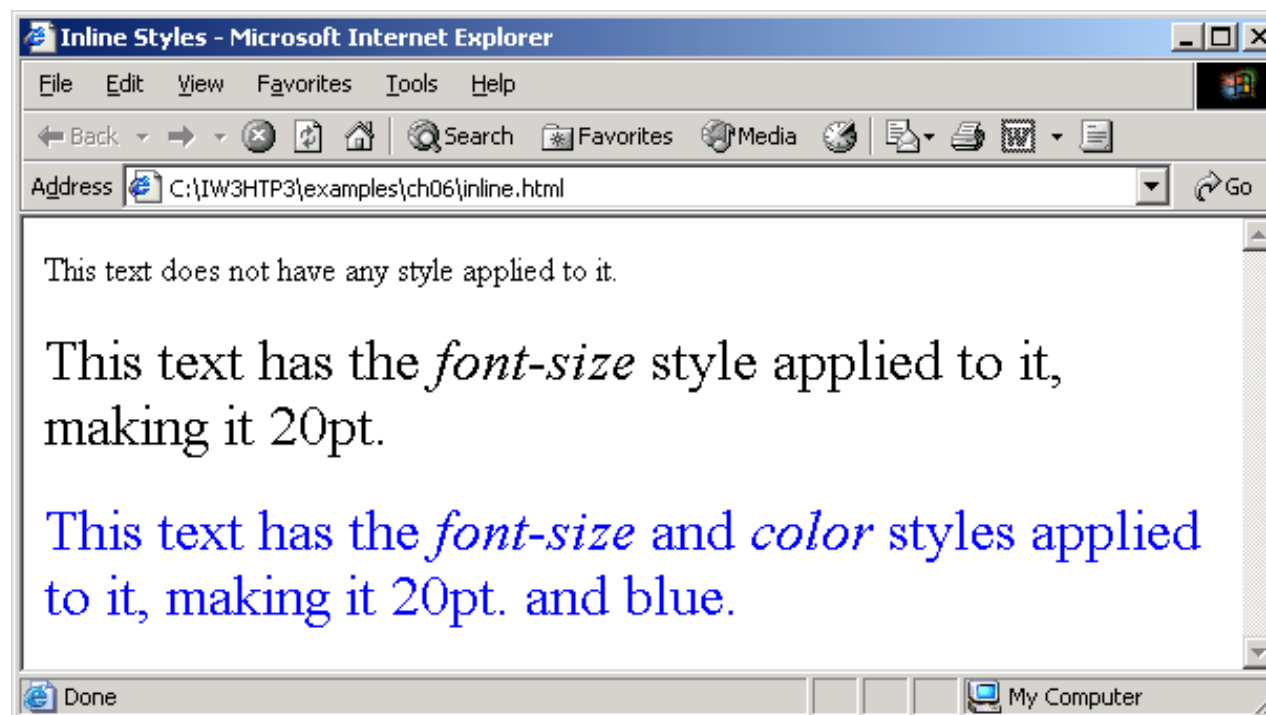

Outline

```
1 <?xml version = "1.0"?>
2 <!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.1//EN"
3     "http://www.w3.org/TR/xhtml11/DTD/xhtml11.dtd">
4
5 <!-- Fig. 6.1: inline.html -->
6 <!-- Using inline styles -->
7
8 <html xmlns = "http://www.w3.org/1999/xhtml">
9     <head>
10         <title>Inline Styles</title>
11     </head>
12
13     <body>
14
15         <p>This text does not have any style applied to it.</p>
16
17         <!-- The style attribute allows you to declare -->
18         <!-- inline styles. Separate multiple styles -->
19         <!-- with a semicolon. -->
20         <p style = "font-size: 20pt">This text has the
21         <em>font-size</em> style applied to it, making it 20pt.
22         </p>
23
```

```
24 <p style = "font-size: 20pt; color: #0000ff">  
25 This text has the <em>font-size</em> and  
26 <em>color</em> styles applied to it, making it  
27 20pt. and blue.</p>  
28  
29 </body>  
30 </html>
```

Embedded Style Sheets

- this method can only specify style information for the current document:
 - 1:1 relationship
 - However, the same document may have other style definitions applied to it
 - 1:M relationship
- embedded style sheet rule will have higher precedence than external style sheet rule, if there is a conflict between styles
- embedded style sheet rule will have lower precedence than an inline style sheet rule

Embedded Style Sheets

- Embed an entire CSS document in an XHTML document's head section inside a `style` element
 - Attribute type
 - Multipurpose Internet Mail Extensions (MIME) type
 - describes the type of the document's content
 - `text/css` is the type for CSS document
 - Style properties are defined for:
 - Existing defined elements, such as `p` (paragraph), `h3` (header), `li` (list) or any other
 - *Style class* that can be applied to either:
 - Any existing type of element in the body of the document or
 - One specific element in the document

CSS Syntax for Assigning Style Properties

- The CSS syntax is made up of three parts: a selector, a property and a value:
 - `selector {property: value}`
- A selector can be:
 - the HTML element/tag you wish to define. In this example:
 - `body {color: black}` , element `body` is the selector
 - The class selector, which can be tied to a specific element, such as:
 - `p.right {text-align: right}`
 - The class selector applicable to any element, such as:
 - `.loud {font-family: fantasy; font-size: xx-large}`
- If a class selector is used, it has to be invoked in the body of the XHTML document:
 - `<p class="right">` or
 - `<table class="loud">`

CSS Syntax for Assigning Style Properties: additional issues

- Group selectors are possible for a group of HTML elements. For example:
 - `h1,h2,h3,h4,h5,h6 {color: green}` will make all header elements text green
- When a class selector is defined for a particular element, it can not be invoked on other elements. Using example from the previous slide which of these uses of class styles in the XHTML document is correct?
 - `<ul class = "loud">`
 - `<ul class = "right">`
- Pseudo-class selectors define the style for the parts of a document based on some characteristics other than tag name, attributes or content. They may be defined by a user action such as:
 - Mouseover (hover pseudoclass)
 - Clicking (active pseudoclass)

CSS syntax: continue

- Invoking a style class to a block of text not defined by a particular element
 - `span` element
 - `div` element (block level element)

Style Inheritance and Conflict Resolution

- Inheritance

- An element that is present within another element (child) inherits all style properties from its “parent” element
- However, if such child (or descendant) element has properties that conflict with defined properties of its parent element, conflict is resolved in favors of properties of a child element
 - Child element properties have greater *specificity* than ancestor’s properties

```
1 <?xml version = "1.0"?>
2 <!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.1//EN"
3     "http://www.w3.org/TR/xhtml11/DTD/xhtml11.dtd">
4
5 <!-- Fig. 6.2: declared.html -->

50         Go to the Grocery store</a></p>
51
52     </body>
53 </html>

```

External Style Sheets

- External style sheets
 - Applicable to more than document
 - Documents can have more than one source for style specification
 - M:M relationship
- Can provide uniform look and feel to entire site
- Same CSS syntax rules for assigning and invoking style properties apply

External Style Sheets

- Location (`href`) and type (`type`) of the external style sheet are specified as attributes of a `link` element in the head portion of an XHTML document
- In addition, the `rel` attribute specifies the nature of the relationship between the stylesheet and the document that is referencing it
 - Persistent stylesheets must be applied to the document
 - Preferred style sheet should be applied the unless the user has selected a different alternate
 - Alternate style sheets may be selected by users depending on their preferences

Linking External Style Sheets

- To make a style sheet *persistent*, set the rel attribute to "stylesheet".
- To make a style sheet *preferred*, set the rel attribute to "stylesheet" and name the style sheet with the additional title attribute.
- To specify an *alternate* style sheet, set the rel attribute to "alternate stylesheet" and name the style sheet with the title attribute.

```
1  /* Fig. 6.4: styles.css  */
2  /* An external stylesheet */
3
4  a      { text-decoration: none }
5
6  a:hover { text-decoration: underline;
7            color: red;
8            background-color: #ccffcc }
9
10 li em   { color: red;
11           font-weight: bold;
12           background-color: #ffffff }
13
14 ul      { margin-left: 2cm }
15
16 ul ul   { text-decoration: underline;
17           margin-left: .5cm }
```

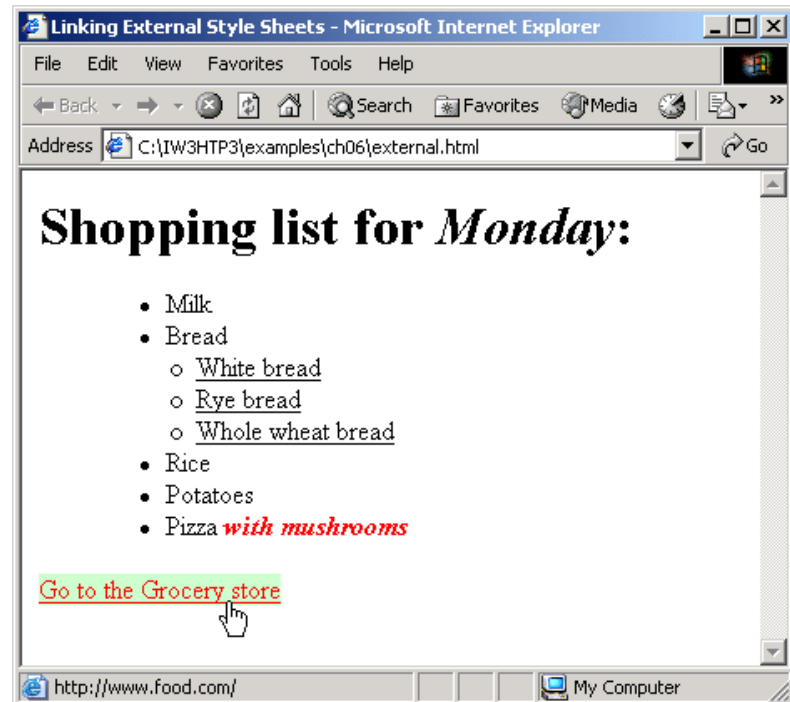

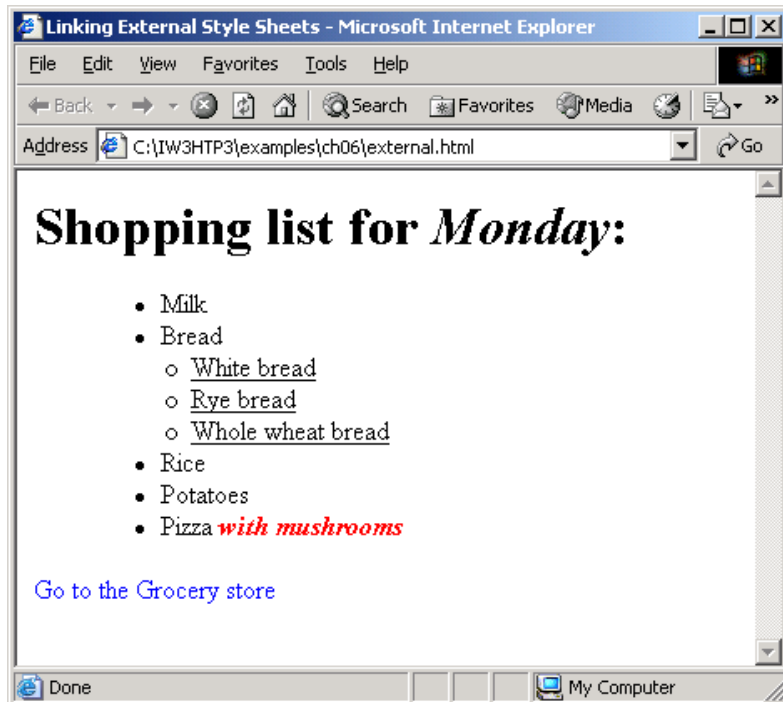

```
